

# Creating a small bird habitat haven

[www.habitatnetwork.org](http://www.habitatnetwork.org)

Your habitat haven may be as big or small as your garden will allow. It may be a pie-shaped wedge in a corner or long and narrow or just the protective spiky circle.

**Inner sanctum**  
Taller, softer shrubs 1-2 meters in height. Provides a safe haven away from bigger birds. A vine may be grown to provide a protective cover, however may be difficult to manage.  
*Pomaderris, native Grevillea, Ozothamnus, Leptospermum.*

**Protective circle**  
Spiky, protective shrubs 1-2 meters high, planted 20 to 25 cm apart.  
*Hakea, Acacia ulicifolia, Bursaria, Banksia, Lambertia.*

**Biodiverse shrub circle**  
Small, attractive shrubs add interest to a garden for people, birds and animals. This layer provides food and shelter.  
*Dianella, native Geranium, Indigofera, Prostanthera.*

**Eating out**  
Mixed native grasses and ground covers offer a variety of foods from seeds to insects.  
*Pratia, native Violet, native Geranium, Microlaena.*
